

## Before you start measuring for turf:

When measuring your area, keep in mind that grass is sold by the square foot, and generally comes on 100-foot rolls. These rolls are available in 15 or 7.5-foot widths. We can cut any length of grass up to 100' but cannot cut to width.

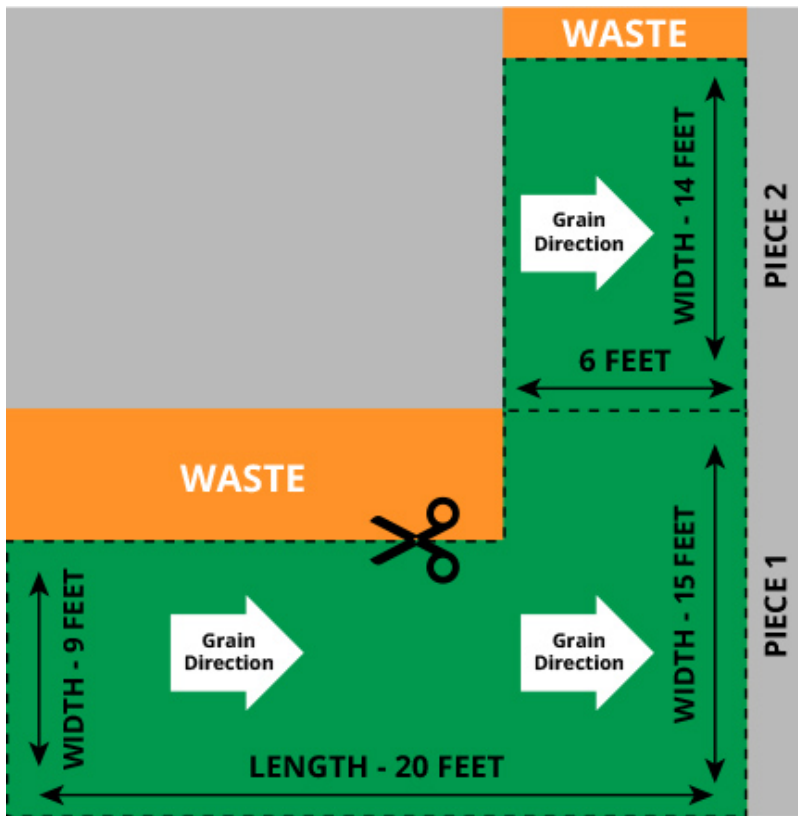

Synthetic grass is directional, meaning the blades angle slightly in one direction. If your yard requires more than one piece of turf, it is important to keep the grain going in the same direction. Otherwise, you will have noticeable seams and it will appear to be mismatched.

We recommend sketching out your area and taking good measurements. Take measurements based on turf being directional. You can also bring your drawing to any of our stores or email the diagram to us and we can advise the amount of turf required to complete the install. Waste factor on most projects is around 20%, putting greens around 25%.

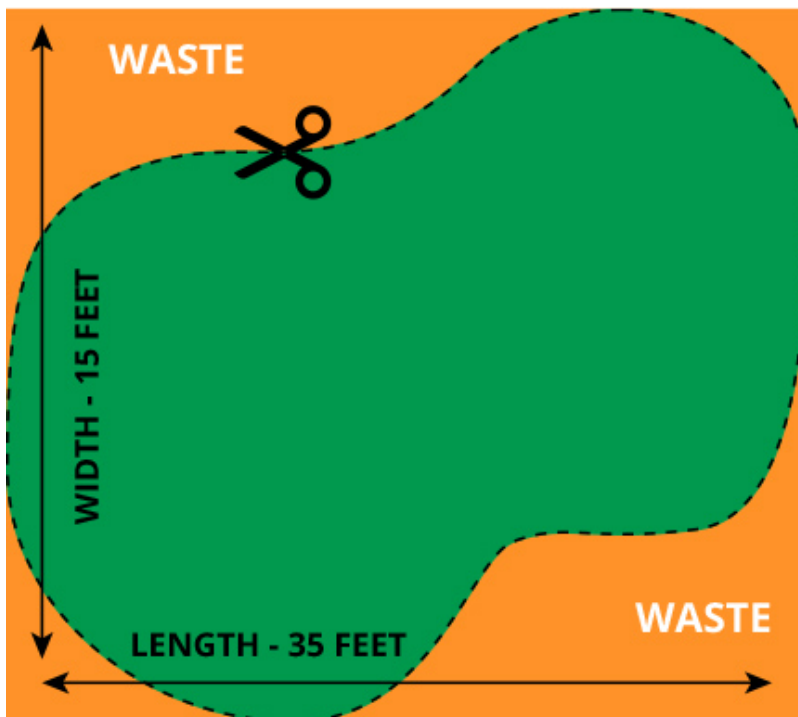

## Rectangular Sections:

For rectangle or square shapes, you will measure at the widest point for both the width and the length. In the diagram shown, the area is 13' wide by 20' in length. In this instance, because we can only cut the length and not the width, you will be ordering a 15' x 20' piece of grass - 300 sq. ft.

## L-shaped Sections

For L-shaped areas, keep in mind that the grass blades are directional so you will be ordering at least 2 pieces. In the diagram shown, there are two areas to measure: piece 1 is 9' wide on the left edge, 15' wide on the right edge, and 20' long. In this instance, because we can only cut the length and not the width, you will be ordering a 15' x 20' piece and a 15' by 6' piece.

## Non-standard Sections

For non-standard shapes, you will measure at the widest point for both the width and the length. For instance, in the diagram shown, the area is 15' wide by 35' in length. In this instance, because we can only cut the length and not the width, you will be ordering a 15' x 35' piece of grass - 525 sq. ft.
